SAS®-with-Excel Application Development Tools and Techniques, Expanded Edition LeRoy Bessler, Assurant Health, Milwaukee, Wisconsin, USA

Abstract

The commonest non-SAS tool for data presentation, and working with data, is Microsoft Excel. Other people may want your SAS report formatted as a spreadsheet. Dynamic Data Exchange (DDE) can empower and augment your use of SAS with Excel. You can develop SAS programs to load worksheets, and to format them without point-and-click. Almost anything that you can do directly in Excel can also be done using DDE commands from your SAS program. You can access Excel data, even to the level of a specific cell, row or column, part of a row or column, or set of contiguous rows or columns, or can work with an entire worksheet. Then you can write, read, or format data. Why would you want to run Excel from SAS? You can create a hands-off production job to be automatically scheduled by the computer to access and analyze the data, load the spreadsheet, format it, and attach the report to a SAS-dispatched email message. In any case, if you find yourself preparing the same Excel report over and over, why not automate it? The intended audience is all levels of SAS users.

Introduction

This paper and its companion slide presentation are an introduction to a SAS-with-Excel self-study collection of sixty macros and twenty-six sample programs (with substantial comments), and supporting files, which are available at no charge from the author via email (at bessler@execpc.com).

To find out more about the Excel commands used here to work with DDE, or to find other commands or command options not used here, you must consult the documentation in Macrofun.hlp. To get that information, you must install Macrofun.hlp by initially downloading Macrofun.exe from the Microsoft Download Center, and then run the .exe file. If you are not experienced using the Download Center, you can find the right part of it by using google.com to search for "macrofun.exe", or instead you could try this URL: http://support.microsoft.com:80/support/kb/articles/Q128/1/85.ASP.

NOTE: The Appendices contain information not included in the original version of this paper, which was limited to 20 pages for publication. See Appendix 1 for usage cautions, Appendix 2 for a ways to refresh pivot tables, Appendix 3 for ways to insert (and resize) graphs, either standalone on separate worksheets, in groups on a worksheet, or with a companion table, and Appendix 4 for two ways to do subtotals.

DDE: Dynamic Data Exchange

Client-Server Architecture

Your SAS session is a client. It opens Excel, which acts as a server. Your SAS program:

- 1. Starts/Executes Excel
- 2. Establishes a channel to talk to Excel
- 3. Opens a new/existing XLS file (workbook)
- 4. Sends commands to Excel
- 5. Saves, or Saves As (new or different), XLS file
- 6. Exits/Stops Excel

What Can You Do with DDE?

Anything that you might do in Excel with your keyboard and mouse! Here I cover <u>only a subset of</u> the input/output and formatting possibilities. When DDE cannot do it (rare), you can pre-record an Excel macro and run it with DDE.

Some of the Cell Formatting Options

- Font controls available include: font, style, size, color, and underline.
- Cell background can be filled with color.
- Cell sizing is possible, and column or row AutoFit and column or row Hide/Unhide.
- Cell alignment, cell merge, text wrap, etc. can be done.
- Borders can be created, e.g., to section the worksheet.
- Cell content can be indented, using two tricks shown in sample programs.

Some of the Worksheet Controls

- Select worksheet, cells, rows, columns
- Freeze/Unfreeze panes
- Turn AutoFilter On/Off
- Generate subtotals in a worksheet
- Control/Change levels for Excel subtotals (or create multiple custom sheets for various levels of totals)
- Activate a specific worksheet in a workbook
- Create additional worksheets in a workbook
- Delete unused worksheets in a workbook

Some of the Other Manipulation Possibilities

- Insert/Delete columns or rows
- Find, Find and Replace cell contents
- Copy cells, Move cells
- Use formulas to create new column(s)
- Use Zoom to shrink or enlarge a worksheet
- Control the Message text box in the lower left corner of the Excel window

The Mechanics of DDE and the Basic SAS-with-Excel Interaction

Channel for DDE Commands

DDE commands require use of special SAS filename statements:

filename YourFileRef dde "excel|system";

YourFileRef is arbitrary 1-to-8 characters. I like DDEcmds.

FILENAME Statement Assignments to Read or Write Data with DDE

Identification of the current selection of worksheet and a rectangle of cells for read or write is accomplished with:

EXCEL | YourSheet!RpppppCqqq:RsssssCttt

ppppp is 1-to-5-digit start/top row number **qqq** is 1-to-3-digit start/left column number **sssss** is end/bottom row number **ttt** is end/right column number

Row/column numbers with leading zeros are permissible.

Other ways to make selections of cells are as follows:

RpppppCqqq	-	single cell
Rppppp:Rsssss	-	range of rows
Rppppp	-	single row
Cqqq:Cttt	-	range of columns
Cqqq	-	single column

See the section "Insert a Heading for the New Column 4" for a simple example of the FILENAME statement used for writing data with DDE. For more examples of writing data to Excel from SAS, see Reference 1.

Coding the Cell Selection

You are not required to permanently hard code it. You can use DDE select functions to operate based on criteria assigned by you (as in some examples below). Or you can use macro program code to determine the selection target dynamically (as in examples from the tools package available via email).

Excel DDE Commands

Microsoft developed DDE commands for an earlier version of Excel than the current one. I have used them with various versions of Excel and Windows. Almost all of the commands (that I have tried) work for me, but I can offer no guarantees.

The commands are documented in Macrofun.hlp, which you can download from Microsoft as mentioned above. "Macrofun" is an abbreviation for "Macro Functions", not "Macro Fun", but these macros functions are fun to use. They do not require use of Excel macros.

Please be aware that not every DDE command works (e.g., rename worksheets, create subtotals, . . .), and some command options may not work. Nevertheless, what *does* work is an <u>enormous</u> tool set!

true / false Values for DDE Commands

These are used to turn options On / Off in DDE command parameter assignments. For some commands you are required to use 1 / 0 instead.

Basic DDE Functions

- 1. Start Excel: provides a default empty workbook, with three worksheets
- 2. Open an existing workbook
- 3. Save As of the current workbook with a new name
- 4. Exit Excel

All of the examples presented in the "Tour of DDE Examples" assume that Steps 1 and 2 of Basic DDE Functions have already been completed.

Starting Excel from SAS

For other versions of Microsoft Office or Excel than what I used for my development, you may need to use a folder path in your code different from that used in this Excel start-up code:

```
x '"C:\Program Files\Microsoft Office\Office\EXCEL.exe"';
data _null_;
z=sleep(3); /* wait 3 seconds for Excel to start */
run;
```

The above program opens a new workbook, with three empty worksheets: Sheet1, Sheet2, and Sheet3.

Open Existing Workbook from SAS

```
data _null_; /* talk to DDE, no output data */
file DDEcmds;
put '[open("c:\YourFolder\YourWorkbook.xls")]';
x=sleep(3); /* wait 3 seconds for it to open */
run;
```

Finished Workbook Save As

```
data _null_;
file DDEcmds;
put '[error(false)]';
put '[save.as ("c:\OtherFolder\DifferentFileName.xls")]';
x=sleep(1);
run;
```

Exiting Excel from SAS

```
data _null_;
file DDEcmds;
put '[error(false)]';
put '[quit()]';  /* empty parenthesis */
run;
```

The **error(false)** command tells Excel that you do not want a prompt to ask for confirmation of intention.

SAS-with-Excel Libraries of Programs and Macros (available via email)

- 26 heavily commented sample programs
- 5 empty, but specially preformatted, spreadsheets to use in sample programs
- Text files of color definition information
- 60 macros for your use, with example invocations in sample programs

Running sample programs with "OPTIONS MPRINT;" shows generated SAS code in the SAS log. This enables you to understand what any macro does. If you wish to avoid use of a macro, you can copy generated code from the SAS log, strip off the MPRINT prefix at the left margin, and adapt that code to other uses without the macro.

Tour of DDE Examples

All of the examples presented in this "Tour of DDE Examples" assume that Steps 1 and 2 described in the Section "Basic DDE Functions" have already been completed.

Not On the Tour: For a simple example of how to load data into Excel with DDE, rather than use a preexisting workbook or have the data preloaded with PROC EXPORT, please see the table-load section of the third example in Appendix 3. Although Appendix 3 is ostensibly devoted to getting SAS/GRAPH output into Excel, the third example includes both a graph and a table.

We will use an Excel workbook which is loaded with data from SASHELP.CLASS and <u>initially</u> uses the default Excel formatting.

All illustrations in this paper present screen images at full page width to maximize readability. There will be pages with lots of white space at the bottom. By limiting each page to one screen image at most, it is easier to present code and its result together on the same page.

Font Formatting – Step 1

Activate worksheet (if not already there). Select the cells to be formatted

```
data _null_;
file DDEcmds;
put '[workbook.activate("CLASS")]';
put [select("R5C3:R7C5")]';
run;
```

Cells to be formatted Selected:

Font Formatting – Step 2

Let's use:

- font Verdana
- style Bold
- size 16 point
- (Excel) color 3 red

Here's how (those commas are very important, and represent unused but available options):

```
data _null_;
file DDEcmds;
put '[font.properties("Verdana","Bold",16,,,,,,3)]';
run;
```

The font is changed, but is obscured by the cell selection box and shading:

															_		_						-
		455 /									İ.	•	_	-								Þ	
Read	ау													Sum	1=45	9.1							

Font Formatting – Step 3

After the block of cells has been formatted, the necessary predecessor

select ("R5C3:R7C5") command leaves them highlighted (just as a mouse would). But I want to see the new font color. So, move the focus with:

```
data _null_;
file DDEcmds;
put '[select("R1C1")]';
run;
```

"I can see clearly now."

Font Formatting Can Be Done All In One Step

```
data _null_;
File DDEcmds;
put '[workbook.activate("Class")]';
put '[select("R5C3:R7C5")]';
put '[font.properties("Verdana","Bold Italic",16,,,,,,3)]';
put '[select("R1C1")]';
run;
```

DDE Command Format

In a command of the form

put '[CommandName(arg1,arg2,...,argN)]';

the **CommandName** may be multi-word, dot-separated.

For an example with several (in this case, four) command arguments, there are three ways to indicate omission of one argument—

- if at start of list: ,arg2,arg3,arg4
- if in middle of list: arg1,,arg3,arg4
- if at end of list: arg1, arg2, arg3 (i.e., just omit)

Color the Cell Background

run;

] <u>F</u> ile <u>E</u> dit <u>V</u>		C lass.xls F <u>o</u> rmat <u>T</u> ools	<u>D</u> ata <u>W</u> ind	dow <u>H</u> elp											- 8

Using Formulas in Excel

Normally, one could create all the Excel report data in SAS pre-spreadsheet-load processing. Suppose, however, we want columns derived from Excel subtotals. For demo only, we will work with simple spreadsheet content, without subtotals. With subtotals present, the use of Excel formulas works the same.

Insert a New Column to the Left of Column 4

```
data _null_;
file DDEcmds;
put '[select("C4")]';
put '[insert(4)]'; /* 4 specifies type of INSERT */
run;
```

Prepare for a Division Operation

Column 3 is to be the divisor. For this demo, set some of its cells to null (missing) values, and some other cells to zero values.

```
data _null_;
file DDEcmds;
put '[select("C3")]';
put '[formula.replace("16","",1,,false,false)]';
put '[formula.replace("12","0",1,,false,false)]';
put '[select("R1C3")]'; /* remove highlight */
run;
```

Note the Presence Now of Some Zero Values and a Null in the Age Column:

Conclusion

There are other ways to generate Excel reports with SAS, but DDE is the method I prefer. Its astonishing power has impressed me. The examples above are only a small subset of what you can do with DDE. Though still just a larger subset of DDE's power, available at no charge via email at the address below are my 60 macros, 26 sample programs (commented), and supporting files, to implement the above and other functions, including:

- Cell sizing
- Column or row Hide/Unhide
- Cell merge, text wrap, etc.
- Create borders to section the worksheet
- Indent cell content
- Freeze/Unfreeze panes
- Turn AutoFilter On/Off
- Generate subtotals in a worksheet
- Control/Change levels for Excel subtotals (or create custom worksheets for various levels of totals)
- Create additional worksheets in a workbook, Delete unused worksheets in a workbook
- Delete columns or rows
- Copy cells, Move cells
- Use Zoom to shrink or enlarge a worksheet
- Control the Message text box in the lower left corner of the Excel window
- Run Excel macros

Appendix 1: Important Information about Using DDE for SAS-with-Excel

If you use DDE for SAS-with-Excel on your desktop/laptop, you may not have any problems. You have control of all Excel options, and you can see everything that is happening with SAS and Excel.

If you have to use SAS and Excel on a remote server, there are some things to be aware of.

1. Possible Excel Situation

If your code has a malfunction, an Excel session may be left open on the server. If it had an Excel file open, the file will remain open. If you do not have Remote Desktop or some sort of terminal access to the server, you will need to have a Windows System Administrator close the file and terminate the Excel session for you.

2. Possible SAS Situation

If you are using SAS Enterprise Guide as a client for that remote server and your code has a malfunction, a SAS process may remain running or "hung" on the server. If your version of SAS EG permits you to kill the process, you may not have a problem. If your version of SAS EG does not permit you to kill the process, and you do not have Remote Desktop or some sort of terminal access to the server, you will need to have a Windows System Administrator kill it for you.

3. Possible Excel Situation

Only two of the examples involve the use of a custom Excel macro. Excel on your server may be set to inhibit the use of such Excel macros, or may put certain conditions on their use. If so, you need to work with your Windows System Administrator either to get the inhibition removed or to find out what you need to do get your macro(s) authorized to run.

Appendix 2: Using Dynamic Data Exchange to Load a Pivot Table from SAS with Your SAS-prepared Data

Abstract

This coding tidbit shows you how to load a pivot table with SAS by running a pre-recorded custom Excel macro via DDE.

Introduction

Knowing that pivot tables are a very common destination of SAS-originated data, whether prepared with PROC SUMMARY or some other method, and being a DDE enthusiast, I long wanted to use DDE to create pivot tables. There appears to be some machinery available, if you read MacroFun.HLP, but I could not get it to work. When I asked Cynthia Zender from SAS Institute about my problem, she suggested pre-recording an Excel macro to handle the load, and then running the Excel macro with DDE. I had a little bit of experience with that, and so this solution is the result.

For a different way to create pivot tables from SAS, please see Conway's work in Reference 1.

Solution

The code below is meant to be self-explanatory, and it assumes that you have already worked through other information, including the main body of the paper and the more basic sample programs that are in the BesslerSASandExcel zip file package available via email. It uses SAS macros from that package.

```
* UseCustomPreRecordedPivotTableMacro.sas *;
```

```
* NOTE:
 To use this sample code,
 you can choose to highlight specific code blocks
 and submit them individually.
 This sample program need not be submitted and run en masse.
 Once Excel has been started and a spreadsheet has been opened,
 you can toggle over to the Excel window
 after each SAS code execution step
 to inspect the results. *;
* These folders can, of course, be named anything you prefer,
 but the expected macros, input data, or output data
 must be stored there. *;
%let FolderForMacros = C:\BesslerSASandExcel\macros;
%let FolderForXLSfiles = C:\BesslerSASandExcel\spreadsheets;
%let FolderForXLSoutput = C:\BesslerSASandExcel\output;
* tell SAS where the macros are stored *;
filename SASandXL "&FolderForMacros";
* search for macros in the order listed *;
options sasautos=(SASandXL sasautos);
options mprint; * list the resolved translation of any macros
                  in the SAS log *;
* Specifying the location of the Excel executable *;
%XLStart(ExcelPgm=C:\Program Files\Microsoft Office\Office10\EXCEL.exe);
%XLDDEcmdsFileName;
```

```
* open the workbook that contains the macro(s) *;
%XLOpen(WorkBook=&FolderForXLSfiles.\PivotTableMacroForSASHELPdotCLASSweightVar.xls);
* open the workbook to be processed with the macro(s) *;
%XLOpen(WorkBook=&FolderForXLSfiles.\TempClass.xls);
* run the macro *;
* The DDE Pivot function refused to work for this situation.
 that's why I use the pre-recorded macro instead. *;
%XLRunMacro(WorkBook=PivotTableMacroForSASHELPdotCLASSweightVar.xls,
           XLMacro=Macrol);
%XLDeleteWorkSheet(WorkSheet=CLASS);
* save the result with a new XLS file name *;
%XLSaveAs(WorkBook=&FolderForXLSoutput.\sasHelpClassWeightVarInPivotTable.xls);
* Close that WorkBook *;
%XLClose;
* Close the Excel Macro WorkBook *;
%XLClose;
* Exit *;
%XLExit;
```

Appendix 3: Using DDE to Insert and Re-Size SAS-Created Graphs

Abstract

These sample programs show you how to use DDE to insert (and, if desired, re-size) graphs, either standalone on separate worksheets, in groups on a worksheet, or with a companion table.

Introduction

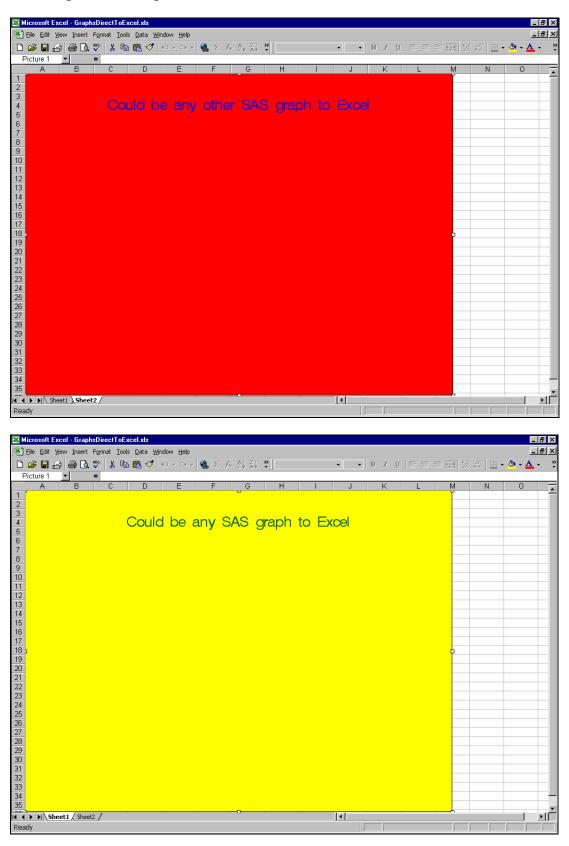

I have often been asked how to use DDE to create Excel worksheets that contain SAS/GRAPH output, and always had to say that I did not know. Since in other papers I have been exploring and explaining how to create SAS graphs in a wide variety of different delivery contexts, I finally decided to investigate Excel via DDE. Here no use is made of my SAS-DDE macros. All of the programming is explicit and hard-coded. The new DDE tools used are the INSERT.PICTURE and FORMAT.SIZE functions.

Examples of SAS/GRAPH to Excel via DDE

The code below is meant to be understandable without further explanation, and assumes that you already understand basic DDE functions.

In all three examples, a new Excel workbook is opened, one worksheet is customized, and the remaining two sheets present by default are deleted. Instead, a pre-existing workbook could be used and customized, by modifying a pre-existing worksheet or a newly inserted one.

Since these examples are meant to demonstrate how to get SAS/GRAPH output into Excel, and not to teach you how to use SAS/GRAPH, the "graphs" are merely text slides that are trivial to create.

Two Graphs to Two Separate Worksheets

Here is the code used to create the Excel workbook above:

```
goptions reset=all;
goptions device=GIF;
goptions border; /* Put the graph in a box. */
goptions gsfmode=replace gsfname=anyname;
proc gslide;
filename anyname "C:\image1.GIF";
goptions cback=CXFFFF00; /* Use RGB Yellow for background. */
  /* Use RGB Medium Dark Green for title. */
title1 ' ' justify=CENTER height=2 color=CX006600 'Could be any SAS graph to Excel';
run:
filename anyname "C:\image2.GIF";
goptions cback=CXFF0000; /* Use RGB Red for background. */
 /* Use RGB Blue for text. */
title1 ' ' justify=CENTER height=2 color=CX0000FF 'Could be any other SAS graph to
Excel';
run;
quit;
options noxwait noxsync;
x '"C:\Program Files\Microsoft Office\Office\EXCEL.exe"';
data _null_;
z=sleep(3); /* wait 3 seconds for Excel to start */
run:
filename DDEcmds dde "excel|system";
data _null_;
file DDEcmds;
put '[workbook.activate("Sheet1")]';
put '[insert.picture("C:\image1.GIF")]';
put '[format.size(600,450)]'; /* this really keeps it unchanged */
put '[workbook.activate("Sheet2")]';
put '[insert.picture("C:\image2.GIF")]';
put '[error(false)]';
put '[workbook.delete("Sheet3")]';
put '[error(false)]';
put '[save.as("C:\GraphsDirectToExcel.xls")]';
z=sleep(3); /* wait 3 seconds for Save to end */
put '[error(false)]';
put '[quit()]'; /* empty parenthesis */
run;
```

Appendix 4: SAS Creation of Excel SubTotals

This information was not included in the original version of the paper. It includes: (a) text copied from the extra slides in the presentation; and (b) captioned slides of Excel screen print images.

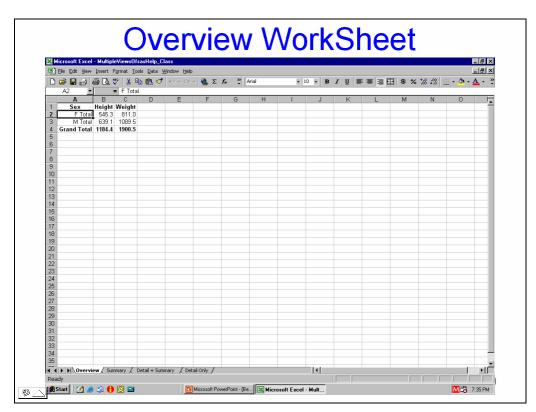

Excel Subtotals: Two Solutions

- 1. Separate Custom Worksheets for each level
- 2. DDE use of Excel's subtotals (requires a pre-built Excel macro for one step)

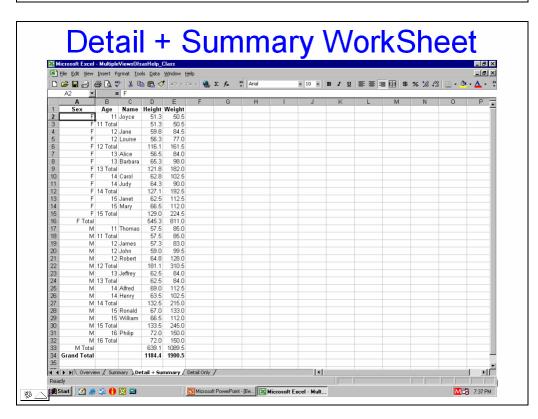

Excel Subtotals Solution 1: Separate Custom Worksheets for Each Level

An Alternative to Excel Subtotals

- Custom Design: Really "Have It Your Way"
- Prepare multiple pre-formatted empty WorkSheets
- Load them via DDE
- May have to use Software Intelligence for post-load formatting
- User moves from "level" to "level via Tab Navigation, not Excel "Level Buttons"
- Here showing only results, not code

Removing the Extra Grand Total

First, Reformat & Save

```
data _null_;
file DDEcmds;
put '[select("R1")]';
put '[font.properties("","Bold")]';
put '[select("C1:C5")]';
put '[column.width(,,,3)]';
put '[column.width(,,,3)]';
put '[error(false)]';
put '[save.as("C:\Folder\DataWithSubtotals.xls")]';
x=sleep(1);
run;
```

Remove Extra Grand Total, Part 1: Find Second from Last Row & Put Row Number in Symbol Table

```
filename Column DDE "EXCEL|CLASS!R1C1:R65536C1" notab;
data _null_;
length FirstCharInColumnCell $ 1;
infile Column truncover end=LastObs;
input FirstCharInColumnCell;
if LastObs;
call symput("RowToRemove",trim(left(_N_-1)));
run;
```

Remove Extra Grand Total, Part 2: Select Second from Last Row & Delete It

```
data _null_; file DDEcmds;
put '[select("R' "&RowToRemove" '")]';
/* resolves to: put '[select("R34")]'; */
put '[edit.delete(3)]';
run;
```
