Using graph template language to customize ODS statistical graphs

Dongsheng Yang, Cleveland Clinic Foundation, Cleveland, OH
Anne S. Tang, Cleveland Clinic Foundation, Cleveland, OH

ABSTRACT
Different from the traditional SAS/Graph in SAS 9.2, ODS statistical graphics from procedures provide an easy and quick way to explore and visualize data. However, if you want to generate high quality plots for reports and publications, graph template language is a powerful tool to customize and build stand-alone ODS statistical graphs. This paper describes how to output SAS codes and data objects of an ODS statistical graph generated from a statistical procedure, and then use graph template language to customize graph templates and style templates. An example on customizing Receiver Operating Characteristic curves (ROC) step-by-step is provided.

INTRODUCTION
Many statistical procedures in SAS9.2 automatically provide ODS graphics. Those ODS graphics are generated by the Graph Template Language (GTL) using the default template. By using GTL, templates can be modified in an easy and flexible way in order to have desired graphs. This presentation shows how to create high quality graphs which are independent of statistical procedures step-by-step. The main steps include:

1. Find the ODS graph template and the data set it used from a statistical procedure using ODS Trace On.
2. Output codes of the interested SAS graph template from ODS graph and its related data object
3. Manipulate the output data set to add any desired points, lines or others which you want to be shown in the graph
4. Modify the style template to control overall appearance
5. Modify the graph template for specific and detailed changes
6. Set up the ODS Destination and ODS graphic statement
7. Run the SGRENDER procedure to associate the appropriate data with the template

Example: “The example 51.8 Comparing Receiver Operating Characteristic Curves in the PROC Logistic from SAS9.2 help documents”.

ODS TRACE ON
By using ODS TRACE ON, we can easily find the name of the interested graph template which was used to create an ODS graphics and the name of related data object in the SAS log window.

Below is ODS TRACE ON output for ROCOverlay object:

Output Added:
--------------
Name: ROCOverlay
Label: ROC Curves
Path: Logistic.ROCComparisons.ROCOverlay
000000000000

1 Object name of an ODS statistical graph. It is the name of the single ROC overlay graph and the corresponding data. So we can use ods select ROCOverlay to select and output a single graph object.
We can output the corresponding data object using statement: ods output ROCOverlay = data set name
2 The name of graph template for ROC overlay curves.
SELECT DEFAULT TEMPLATE CODES

Since SAS has defined default graph template codes for each ODS statistical graph, we can use proc template to display codes of the templates interested either in the SAS window or by writing to an external file from running ODS TRACE ON. The following statements outputs codes of the ROCoverlay template:

```sas
proc template;
run;
```

The codes output in SAS log:

```sas
proc template;
notes "Receiver Operating Characteristic Overlaid Curves";
dynamic _TITLE;
BeginGraph / designwidth=480;
    entrytitle _TITLE;
    layout overlayequated / equatetype=square
        yaxisopts=(gridDisplay=auto_on label="Sensitivity"
            shortlabel="TPR" offsetmin=0.05
            offsetmax=0.05)
        xaxisopts=(gridDisplay=auto_on label="1 - Specificity"
            shortlabel="FPR" offsetmin=0.05
            offsetmax=0.05)
        commonaxisopts=(tickvaluelist=(0 .25 .5 .75 1) viewmin=0
            viewmax=1);
    lineparm   x=0 y=0 slope=1 / extend=true lineattrs=GRAPHREFERENCE;
    seriesplot  y=_SENSIT_ x=_1MSPEC_ / connectorder=xaxis tip=(group y x)
        group=_ROC_ index=_GROUP_ name="Step" primary=true;
    discretelegend "Step" / title="ROC Curve (Area)"
        endlayout;
EndGraph;
end;
run;
```

As we see, codes are well-defined, easy to read and easy to modify. Here is SAS codes and default graph output for a ROC overlay statistical graph. We are going to try to customize axis, fonts, labels, lines, legend and add specific information.

```sas
ods graphics on;/
ods trace on; ①
go dhofw URPRyhud| ②
ods output
ROCOverlay=ROCOverlaydata ROC = myROCdata; ③
proc logistic data=ROC;
    model popind(event='0') =
        alb tp totscore / nofit;
    roc 'Albumin' alb;
    roc 'K-G Score' totscore;
    roc 'Total Protein' tp;
    roccontrast reference('K-G Score')/ estimate e;
run;
ods trace off;
ods graphics off; ④
① represents ODS TRACE ON
```

![ROC Curves for Comparisons](image-url)
MANIPULATE DATA

We may want to make three main changes in the graph:

- Display Only to the third decimal place for the C-statistics in the legend
- Present the ROC curve which had the largest C-statistics in a bold line if those individual curves are intertwined together
- Make the cutoff point with data label along the ROC curve for the variable with largest C-statistics

However, only one data set is allowed to pass into GTL each time. If we want to add more overlays such as points, lines, arrows and plots to the ODS statistical graph, we need to manipulate our data object in the data step.

Here is the part of the generated data set of the ROC overlay which has been used to create the above default ROC overlay plots:

<table>
<thead>
<tr>
<th>Obs</th>
<th><em>SENSIT</em></th>
<th><em>1MSPEC</em></th>
<th><em>ROC</em></th>
<th><em>GROUP</em></th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>0.00000</td>
<td>0.00000</td>
<td>Albumin (0.7366)</td>
<td>2</td>
</tr>
<tr>
<td>2</td>
<td>0.08333</td>
<td>0.00000</td>
<td>Albumin (0.7366)</td>
<td>2</td>
</tr>
<tr>
<td>3</td>
<td>0.08333</td>
<td>0.032258</td>
<td>Albumin (0.7366)</td>
<td>2</td>
</tr>
<tr>
<td>4</td>
<td>0.16667</td>
<td>0.032258</td>
<td>Albumin (0.7366)</td>
<td>2</td>
</tr>
<tr>
<td>5</td>
<td>0.16667</td>
<td>0.064516</td>
<td>Albumin (0.7366)</td>
<td>2</td>
</tr>
</tbody>
</table>

Below is a portion of new data after we made changes in the data step to overlay a thicker line onto the Albumin ROC curve (the variable _x_ and _y_). We also created the new variables "x_cutoff", "y_cutoff" and "cutoff" to mark the cutoff point in the graph.

<table>
<thead>
<tr>
<th>Obs</th>
<th><em>SENSIT</em></th>
<th><em>1MSPEC</em></th>
<th><em>GROUP</em></th>
<th><em>roc</em></th>
<th><em>x</em></th>
<th><em>y</em></th>
<th>y_cutoff</th>
<th>x_cutoff</th>
<th>cutoff</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>0.00000</td>
<td>0.00000</td>
<td>2</td>
<td>Albumin (0.737)</td>
<td>0.000000</td>
<td>0.00000</td>
<td>0.66667</td>
<td>0.12903</td>
<td>3</td>
</tr>
<tr>
<td>2</td>
<td>0.08333</td>
<td>0.00000</td>
<td>2</td>
<td>Albumin (0.737)</td>

<td>Albumin (0.737)</td>
<td>0.064516</td>
<td>0.16667</td>
<td>.</td>
<td>.</td>
<td>.</td>
</tr>
</tbody>
</table>

MODIFY ODS STYLE TEMPLATE

ODS graph style controls the overall appearance of graphic elements which include lines, markers, fonts and colors, fitted lines, confidence bands, prediction limits, and combination of features that are usually required from publication or corporate presentation scheme etc. Although we can modify appearance of a graph by using either ODS style template or graph template. SAS recommend that the better way to control overall appearance which can be used across many graphs is modifying an existing ODS style. For example, we will modify the Journal style which is designed to meet the requirements of most black and white publications as a start point.

The following PROC TEMPLATE code shows the beginning of the style definition on top of journal style. We changed font, font sizes, axis lines, graph boundary lines and line style of individual ROC curve. Only modified codes are shown here.

```sas
ods path work.templat(update sashelp.tmplmst (read));
proc template;
```
define style styles.MyROCoverStyle;
parent = styles.Journal;

style GraphFonts / 
 'GraphDataFont' = ("<MTserif>, Times New Roman", 10pt)
 'GraphUnicodeFont' = ("<MTserif>, Times New Roman", 9pt)
 'GraphValueFont' = ("<MTserif>, Times New Roman", 12pt)
 'GraphLabelFont' = ("<MTserif>, Times New Roman", 16pt, bold)
 'GraphFootnoteFont' = ("<MTserif>, Times New Roman", 10pt, bold)
 'GraphTitleFont' = ("<MTserif>, Times New Roman", 18pt, bold)
 'GraphAnnoFont' = ("<MTserif>, Times New Roman", 10pt);

style GraphAxisLines / Linethickness = 2px;
style GraphWalls / LineThickness = 2px ;
style Graphdata1 / Linestyle = 4;
style Graphdata2 / Linestyle = 1;
style Graphdata3 / Linestyle = 27;
end;

We will make the following changes:

1. Save the customized Style template into work library
2. SAS default template library for ODS statistical graphics. This template will be invoked if the first one does not exist
3. Assign a name to the new style
4. Use Journal style as its parent style
5. Modify fonts or font sizes for axis labels, title, footnote, legend titles, axis tick values and legend entries etc.
6. Modify the line thickness of axis lines and graph boundaries
7. Select types of lines.

MODIFY ODS GRAPH TEMPLATE

An ODS graph style definition provides formatting visual information for a SAS graph output. After we define our new ODS style, we will customize specific visual display on the existing graph template. You can use the graph template language to specify plot layouts (such as lattice or overlays), plot types (such as scatter plots and series plots), text elements (such as titles, footnotes, and insets), and other plot features (such as lines, marker symbols, and colors).

The following statements display the graph template of ROC curves:

define statgraph Graphics.ROCOverlay; notes "Receiver Operating Characteristic Overlaid Curves";
dynamic _TITLE ;
BeginGraph;
  entrytitle _TITLE;
  layout overlayequated / equatetype = square
    yaxisopts = ( gridDisplay = off label = "Sensitivity"
                  shortlabel = "TPR"
                  offsetmin = 0.05
                  offsetmax = 0.05)
    xaxisopts = ( gridDisplay = off label = "1 - Specificity"
                  shortlabel = "FPR"
                  offsetmin = 0.05
                  offsetmax = 0.05)
    commonaxisopts = ( tickvaluelist=(0 .25 .5 .75 1)
                       viewmin = 0
                       viewmax = 1
                      );
lineparm x=0 y=0 slope=1 / extend = true
  lineattrs =( color = grey thickness = 2px); ③

seriesplot y = _SENSIT_ x = _1MSPEC_ /
  connectorder = xaxis
  tip = (group y x)
  group = _ROC_
  index = _GROUP_
  name = "Step"
  primary = true
  lineattrs = (thickness = 2px); ③

seriesplot y = _y_ x = _x_ / LINEATTRS = ( PATTERN = 4 thickness = 3px) ④
  Connectorder = xaxis;

scatterplot y = y_cutoff x = x_cutoff/ datalabel = cutoff
  markerattrs = (size = 10pt symbol = circle weight = bold);

  discretelegend "Step" / Title = "ROC Curve (Area)" ④
    LOCATION = INSIDE
    HALIGN = RIGHT
    VALIGN = BOTTOM
    PAD = (RIGHT = 2PX bottom = 2px)
    ORDER = ROWMAJOR
    ACROSS = 1
    BORDER = FALSE
    TITLEATTRS = (family = 'times' size = 12pt weight = BOLD)
    VALUEATTRS = (family = 'times' size = 10pt);

  endlayout;
  EndGraph;
  run;

① Assign a name to the new graph template
② Close grids
③ Modify default line attributes
④ Overlay a new curve and change the default line attributes
⑤ Overlay a scatter plot and change the default marker attributes
⑥ Modify legend location and its attributes

The DEFINE STATGRAPH statement in PROC TEMPLATE assigns a name to the new graph template definition. DYNAMIC statement defines one dynamic variable which creates the title of the graph. The whole GTL syntax block begins from BEGINGRAPH to ENDGRAPH. The LAYOUT block begins from Layout to ENDLAYOUT to define overlaid in the graph, and it is the main component of a graph template. Couple things we could do within the LAYOUT block include creating a graph overlaid by another graph, changing attributes of AXISOPTS according to our needs, and specifying the color and size of a symbol, text, and legend.

**ODS DESTINATION STATEMENT**

The ODS destination statements will indicate output directory and type of the image. ODS HTML, ODS LISTING, ODS PDF, ODS PS, and ODS RTF are often used here.

ods listing
  style = MyROCoverStyle ①
  image_dpi = 150  ②
  gpath = "h:\Temp";  ③

① Specify the style we defined
② Specify the dots per inch (DPI), which is the image resolution for graphical output
③ Specify the directory where the graphics files are saved
**ODS GRAPHICS STATEMENT**

The ODS GRAPHICS statement enables ODS to create graphics

```plaintext
ods graphics on/reset
   imagefmt  = jpg
   imagename = "MyROCoverlay"
   border    = off
   height    = 6.5in
   width     = 6.5in
   SCALE     = on;
```

- Reset ODS GRAPHICS options to their default settings
- Specify the image format for graphs
- Specify the image file name
- Specify whether to draw the graph with a border
- Specify the height of the graph
- Specify the width of the graph
- Specify whether the fonts and symbol markers are scaled proportionally with the size of the graph

**ODS RUN THE SGRENDER PROCEDURE**

The SGRENDER procedure produces a graph from an input SAS data set and an ODS graph template:

```plaintext
proc sgrender data = rocdata template = Graphics.ROCOverlay;
run;
```

The final customized graph output:
CONCLUSION

ODS statistical graphics in SAS 9.2 provides most common plots within procedures. By using the graph template language, it is convenient to modify and extend default statistical templates to create high quality of graphs.
